migration::center

DATASHEET

Successfully migrate to Hyland Alfresco

The Alfresco connector of migration-center supports migrating documents and folders from many different source systems. For performance reasons one part of the connector is installed on the Alfresco server as an Alfresco Module (AMP). Besides that, the process is fully scalable to manage large data volumes with ease.

Platform consolidation

Replace existing applications with Hyland Alfresco and thus consolidate all legacy platforms into one. With migration-center's Alfresco connector, everything is set to migrate from many different source platforms to Alfresco. The connector works with the Alfresco web services and is fast and reliable. The transformation engine makes it possible to transform the metadata into Alfresco (custom) object types while maintaining all kinds of information of the different source systems.

Data quality enrichment

migration-center offers an extensive range of features aimed at enhancing the data and information quality within our clients' Hyland Alfresco repositories. Through personalized metadata transformation and mapping functionalities, along with seamless integration of external data sources and AI-driven auto-classification modules, our product empowers clients to effortlessly elevate metadata quality. This results in faster information retrieval and enhanced compliance measures.

Rollout

migration-center is a great choice to start with Hyland Alfresco and fill the repository with data for new applications. With source connectors for many major DMS but also for file shares and generic databases, migration-center can migrate to any custom Alfresco configuration via web services. The migration can be conducted in the background and supports a delta mechanism. With this functionality, your old systems or file shares can still be used until the new platform is prepared and productive.

Supported source systems

- ✓ File share
- ✓ SQL Database
- ✓ Hyland Alfresco/OnBase
- ✓ HCL Domino/Notes
- ✓ IBM FileNet IS/CS
- ✓ Microsoft OneDrive/Outlook/SharePoint
- ✓ OpenText eDOCS/Content Suite (xECM)/ Documentum (D2/xCP)
- ✓ … and many more!

Our proven migration approach

migration-center employs a migration approach that adheres to industry best practices. This approach involves six iterative steps aimed at maximizing efficiency and accuracy. These steps can be executed independently and concurrently, allowing for seamless scalability.
One of the key advantages is that they take place within migration-center's database, enabling early detection and resolution of potential transformation or mapping errors before the actual import process begins.
